Number theory in Computer Science

程序代写代做 CS编程辅导

Applications of number theory include:

- Cryptography/Security (primes, divisibility)
- Large integer calculations (modular arithmetic)
- Date and time calculations (modular arithmetic)
- Solving optimization problems (integer linear programming)
- Interesting examples for future topics in this course

Notation for numbers

程序代写代做 CS编程辅导

Definition

- Natural numbers $\mathbb{N} = \{1, 2, \dots\}$
- Integers $\mathbb{Z} = \{\dots, -1, 0, 1, 2, \dots\}$
- Positive integers $\mathbb{N}_{>0} = \mathbb{Z}_{>0} = \{1, 2, \dots\}$
- Rational numbers (fractions) $\mathbb{Q} = \left\{ \frac{m}{n} : m, n \in \mathbb{Z}, n \neq 0 \right\}$
- Real numbers (decimal or binary expansions) \mathbb{R}
 $r = a_1 a_2 \dots a_k . b_1 b_2 \dots$

In \mathbb{N} and \mathbb{Z} different symbols denote different numbers.

In \mathbb{Q} and \mathbb{R} the standard representation is not necessarily unique.

程序代写代做 CS编程辅导

NB

Proper ways to *introduce reals* include Dedekind cuts and Cauchy sequences, neither of which will be discussed here. Natural numbers etc. are either axiomatised or constructed from sets ($0 \stackrel{\text{def}}{=} \{\}, n+1 \stackrel{\text{def}}{=} n \cup \{n\}$)

Divisibility

程序代写代做 CS编程辅导

Definition

For $m, n \in \mathbb{Z}$, we say m divides n if $n = k \cdot m$ for some $k \in \mathbb{Z}$.

We denote this by $m \mid n$.

Also stated as: ' n is divisible by m ', ' m is a divisor of n ', ' n is a multiple of m '

gcd and lcm

Definition

程序代写代做 CS编程辅导

Let $m, n \in \mathbb{Z}$.

- The **greatest common divisor** of m and n , $\gcd(m, n)$, is the largest positive integer d such that $d|m$ and $d|n$.
- The **least common multiple** of m and n , $\text{lcm}(m, n)$, is the smallest positive integer k such that $m|k$ and $n|k$.
- Exception: $\gcd(0, 0) = \text{lcm}(0, n) = \text{lcm}(m, 0) = 0$.

RW: 1.2.9 Let m, n be positive integers

(a) What can you say about m and n if $\text{lcm}(m, n) = m \cdot n$?

They must be relatively prime since always $\text{lcm}(m, n) = \frac{mn}{\gcd(m, n)}$

(b) What if $\text{lcm}(m, n) = n^2$?

m must be a divisor of n

Euclid's gcd Algorithm

Fact

程序代写代做 CS编程辅导

For $m, n \in \mathbb{Z}$, if $m > n$, then $\gcd(m, n) = \gcd(m - n, n)$

Proof.

We first show that for all $d \in \mathbb{Z}$, $(d|m \text{ and } d|n)$ if, and only if, $(d|m - n \text{ and } d|n)$:

" \Rightarrow ": if $d|m$ and $d|n$ then $m = a \cdot d$ and $n = b \cdot d$, for some $a, b \in \mathbb{Z}$,
so $m - n = (a - b) \cdot d$,
hence $d|m - n$

" \Leftarrow ": if $d|m - n$ and $d|n$ then $m - n = a \cdot d$ and $n = b \cdot d$, for some $a, b \in \mathbb{Z}$,

so $m = (m - n) + n = (a + b) \cdot d$,
hence $d|m$

Therefore, any common divisor of m and n is a common divisor of $m - n$ and n , and vice versa.

Therefore, the greatest common divisor of m and n is the greatest common divisor of $m - n$ and n . □
